

Linux Security

By: Matthew Porter

“[UNIX] was not designed from the start to be secure. It was designed with the necessary characteristics to make security serviceable.”

- Dennis Ritchie

Basic Security Guidelines

- Trust No One!
 - ▶ Only trust those who directly have something to lose.
 - ▶ You may be putting your job in that person's hands.
- No Box Is Too Small.
- Pay Attention!

Physical Security

- One of the most ignored areas of security.
- Possible theft of computer and/or hard drive(s).
- Ten seconds to denial-of-service?
 - ▶ Unplug the wires
 - ▶ Reboot the server
- Estimated that insiders initiate 80% of all intrusions.

Physical Security

- BIOS Passwords are a necessary evil, but no guarantee.
 - ▶ BIOS passwords can be wiped out via shorting the battery or a manufacturer-provided jumper switch.
 - ▶ Programs such as !BIOS by Bluefish or AMIDECOD defeat most modern BIOS password protection.
- Use LILO Passwords!
 - ▶ RedHat and Mandrake's infamous 'linux single' boot option.

Physical Security

- Why use LILO Passwords?
 - ▶ Further protection against certain physical security attacks.
 - ▶ RedHat and Mandrake's infamous 'linux single' boot option.
- Three easy steps...
 - ▶ Add the line 'password=xxxxx' in the lilo.conf file
 - ▶ Execute 'chmod 600 lilo.conf'
 - ▶ Execute 'lilo'

Installation Options

- Some Distributions Provide 'Hardening/Secure' Options
 - ▶ SuSE provides numerous packages
 - Secumod = kernel module, including recent setuid fix
 - Seccheck = security-checking scripts
 - ▶ Mandrake offers 'Secure' setting option

Password Security

- Passwords are traditionally stored in `/etc/passwd` in encrypted format.
- However, this is unsafe since `/etc/passwd` is (and MUST BE) readable.
- Therefore, any user can view its contents.

Password Security

The Passwords Are Encrypted, So Who Cares?

- People Often Chose Passwords That Are Easy To Remember
 - ▶ In other words, passwords that are based-on dictionary words, birthdates, names, etc.
- “Script kiddies” Have Access To Password Cracker Programs
 - ▶ **Crack** - <http://www.users.dircon.co.uk/~crypto/index.html>
 - ▶ **John the Ripper** - <http://www.bullseye.net/tools/crackers/john.zip>

Password Security

Protection From Password Attacks

- Shadow Password Suite
 - ▶ Comes with most Linux distributions.
 - ▶ Other shadow suites available, i.e. Shadow In A Box by Michael Quan.
- Proactive Password Checkers
 - ▶ Checking the password when the user chooses a password.
- Hacking Your Own System
 - ▶ **HOWEVER**, ensure that the powers that be approve!!

Network Security

The Basics - Inet and Tcprappers

- Inetd - The Internet Super-Server
- Most distributions add more programs and services than needed.
 - ▶ Classic examples are bind, sendmail, pop3, and imap.
 - ▶ Remove and/or disable unneeded services and daemons.
 - ▶ Audit the system's /etc/inetd.conf file.

Network Security

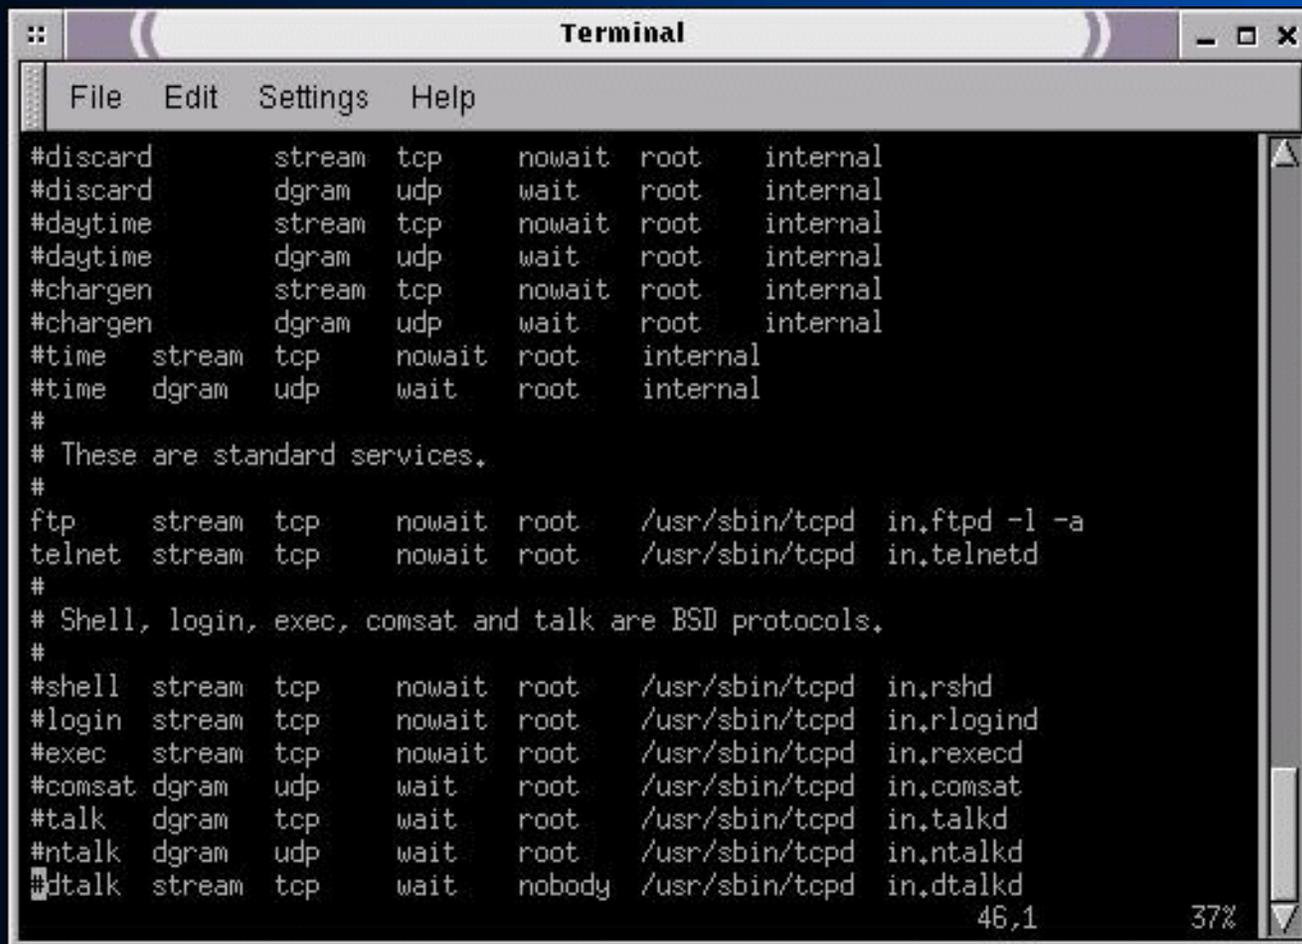

The Basics - Inet and Tcpwrappers

- TCP Wrappers

- ▶ Monitors and controls remote access to services implemented using inetd.
- ▶ Control to services administered via hosts.allow and hosts.deny, in that order.

Network Sniffing At Its Finest

- What is Network Sniffing?
 - ▶ The process in which communication packets are read without the consent and/or knowledge of the user(s).

Network Security

Great the sniffer has packets, who cares?

- Why would someone sniff?
 - ▶ Unencrypted packets include numerous plaintext information (i.e. passwords, credit cards, etc.), among other goodies.
 - ▶ When installed on a gateway (internet or intranet), the sniffer can listen to all packets through the gateway.

Network Security

How Sniffers Work?

- By default, computers listen and respond only to packets addressed to them.
- Sniffers open the NIC card into promiscuous mode.
 - ▶ In this mode, the computer monitors and captures all network traffic and packets passing by- despite their true destination.

Sniffit Sample Output

A terminal window titled "Terminal" with a menu bar containing "File", "Edit", "Settings", and "Help". The terminal shows the command "more linsniff.log" being executed. The output consists of several lines of network-related data: "shaggy => scooby.porter.home [21]", "USER testuser", "PASS secure", "SYST", "PORT 192,168,0,4,212", "LIST -al", "PORT 192,168,0,4,213", "LIST", "PORT 192,168,0,4,214", "LIST -F", "PORT 192,168,0,4,215", "CWD lg", "PORT 192,168,0,4,216", and "LIST -F". The prompt "[matthew@shaggy matthew]\$" is visible at the beginning and end of the output.

```

Network Security

A Detector - PortSentry by Psionic

- What is PortSentry?
 - ▶ An advanced tool that reached beyond simple port scanning. It actually attempts to identify and block the attacker in real-time.

Network Security

A Detector - PortSentry by Psionic

■ PortSentry Features

- ▶ Extensive stealth detection support for FIN, half-open, NULL, “oddball packets”, SYN, and X-MAS-style attacks.
- ▶ Simultaneous TCP and UDP monitoring of multiple sockets.
- ▶ State maintenance (remembering hosts that previously connected) for automagically assigning offending hosts a deny entry in TCP Wrappers.

Network Security

Port Scanning

- Scan the network for potential vulnerabilities and exploits.
- Important tools are PortSentry, SAINT, SATAN, and nmap.
- On-line tools available:
 - ▶ [Http://crypto.yashy.com/nmap.php3](http://crypto.yashy.com/nmap.php3)

Denial of Service

Where did the server go?

- What is A Denial-of-Service Attack?
 - ▶ Any action, initiated by a human or otherwise, that incapacitates a host's hardware, software, or both, rendering the system unreachable and therefore denying service to legitimate users.

Denial Of Service

Examples

- Lpd Bogus Print Requests - Dec. 1998
 - ▶ Attackers send requests to server which they have no account. Lpd cannot resolve or authenticate the user. It then hangs and prevents previous and future print jobs.
- Teardrop.c - Nov. 1997
- Ping Flood

Denial Of Service

How To Protect?

- Denial of Service attacks are widely varied. Therefore, there is no unified combat tactic.
- Some Major Measures:
 - ▶ Patch the software/kernel to solve known problems.
 - ▶ Partition the hard disk in such a way that hackers cannot overflow the partition to cause exceptions in programs.
 - ▶ Set limits to the amount of utilizable resources per each user.

File Integrity

- Linux root kits are tools that can be installed on a compromised server to replace all important utilities with a changed version.
- The main purpose is to hide every information which suggests that the server has been hacked.
- Available at <http://www.rootshell.com/archive-j457nxigi3gq59dv/199812/lrk4.tgz.html>

Security Auditing

Linux Log Files and Third-Party Utilities

- Most Unix/Linux Programs Use The Native System Logger (syslog)
 - ▶ Three primary portions: the syslogd daemon, klogd kernel daemon, and the syslog.conf configuration file.
 - ▶ Examples of program usage:
 - Sendmail
 - Cron
 - Inn

Security Auditing

Linux Log Files and Third-Party Utilities

- **TripWire** free for non-commercial use
 - ▶ A flexible, easy-to-use file integrity tool that employs several algorithms (MD4, MD5, CRC32, SHA).
 - ▶ Each file has a unique fingerprint taken at the initial installation.
 - ▶ Files are checked to ensure that their fingerprints have not changed.
 - ▶ *The Design and Implementation of Tripwire: A File System Integrity Checker* -<http://www.ja.net/CERT/Software/tripwire/TripWire.PS>

Security Auditing

Linux Log Files and Third-party Utilities

- Open Source Tripwire Clones
 - ▶ AIDE
 - ▶ Tripwall
 - ▶ Toby IDS
 - ▶ ViperDB

Hacked! Now What?

- Call the FBI?!
 - ▶ Must show a monetary loss of at least \$20,000.
- Selective Enforcement
 - ▶ Look at the log files and enforce the law against everyone.

Secure Distributions

- **Bastille Linux** - <http://www.gl.umbc.edu/~jbeale1/>
